

Level 6 repeats: bursts are consistent; Trial 29 moves again afterward

Red dashed line: historical Levels 1-4 maximum, not an alarm threshold. Faster preliminary movement can exceed it.
*Trial 27: two early samples excluded from timing; plot starts at the uninterrupted 300-sample segment. Original data retained.
All readings are EWMA-filtered. MSD log plots display zero/tiny values at the axis minimum. Hand simulations do not validate human fall detection.
