

Level 7: continued motion after a burst separates these staged recordings

Lines show one-second means. Green band marks the 3-8 s comparison window; it is not a validated decision delay. First 1-3 s overlap; later motion in fall-labelled trial 29 narrows separation. Two stale prefix rows in trials 27 and 31 excluded only from timing. Level 7 remained hand-held and moving; earlier fall simulations used table rest. No detector accuracy or human outcome inferred.
